

Task:

- Create a Github Repo for this project
- Create a Webpage using AngularJS (1.x) and SASS
- Use the Github API to get all pull requests from the official AngularJS repository (<https://github.com/angular/angular.js>)
- The User should be able to filter the data by Date(earliest / latest), Username (alphabetical / reverse), Title (alphabetical / reverse)
- Username, Date and Title should also be searchable via custom Input.
- Design is completely up to you.

When you are done, please send me the link to the Github Repo to the following email:

Christopher.Giustiniani@bm-tricon.com

Best Regards,

Christopher Giustiniani
